Presenter's Bio

Brendan Mark – Systems Engineer, Boeing Research & Technology

Systems Engineer and Supply Chain MBE Product Owner. As a Systems Engineer, he works closely with BR&T's Integrated Vehicle Systems (IVS) and Mission Systems & Autonomy (MS&A) Integrated Technology Teams to develop technical requirements for buy packages. As a Product Owner, he leads research activities guiding the development of capabilities to enable Supplier MBE. Brendan holds a Bachelor of Science degree in Mechanical Engineering from Bradley University and a Master of Science degree in Aerospace Engineering from Washington University in St. Louis, as well as several professional certificates. He serves on the AIAA Public Policy Committee and the A&D PLM AG Standards team. He also brings five years of Systems Engineering experience from the power industry.

Problem Overview – Supply Chain MBE Perspective

Rising Customer Expectations

- ✓ driving quality across value stream
- ✓ improving engineering integration and efficiency
- ✓ ensuring data & architecture interoperability

What's the challenge?

- OEMs are required to use Digital Engineering (DE) tools and processes to design, develop, test, verify, validate, and certify systems.
- OEMs must levy these same requirements to any subcontractors and vendors at all tiers.
- Digital models must be able to be ingested into customer PLM without loss of context (e.g., metadata, linkages) and functionality

How do we solve it?

- Establish and mature Supplier MBE processes, data and tools – leveraging **data interoperability standards**.
- Guide Suppliers and set clear expectations for collaboration that aligns with Customer needs

Supply chain model-based engineering is a critical part of the digital transformation

Supply Chain MBE Focus Areas

Areas of Emphases for SC MBE

Solutions

Need for Industry Alignment

[Processes] How

- ▶ Promoting Common Frameworks & Methodologies
- Developing Advanced Contractual Methods
- Protecting Intellectual Property During Digital Collaboration

Medium

[Tools] Implementation

- ▶ Assessing Industry Tool Capabilities
- Defining Tool Interfaces & Integration
- Determining Data Authority

Low

[Data] What

- ▶ Technical Data Package Optimization
- Utilizing Model Metadata
- Leveraging Data Interoperability Standards

High

Extending our Digital Thread Architecture with a focus on Data, Processes & Tools

5

Assessing New Tools for Digital Exchange & Collaboration

Emerging technology, tools, and user stories require formal assessment and evaluation

Further assessment of model-based collaboration environments is needed

Technical Data Package Optimization

Utilizing model manifests and data standards to capitalize on metadata

- Metadata is approached with Manifest concept:
 - Identify the asset and related resources, validity, and how to use
 - Protect its content (ownership, Export Control, IP, ...)

Enabling data exchange between stakeholders regardless of the tool

Additional Challenges of Collaboration

- Unknown capabilities of supply base
- Lack of tool vendor support of data interoperability standards
- Model translation (to common standard) and validation
- Change management and configuration control
- IP protection and obfuscation
- Strategies for MBSE data interoperability

Understanding Supplier MBE Capabilities

Creating a data driven approach to Supplier Management

- Supplier MBE Questionnaire (Self Assessment)**
 - Questions to assess suppliers' experience, readiness, and willingness to invest in areas such as:
 - MBSE & product design
 - MBSE design & collaboration tools
 - Adaptation of data interoperability standards
 - Highlights capabilities in domains of interest, including:
 - Spatial-structures & composite models
 - MBSE - architecture, requirements, & math models
 - Includes simple version (for built-to-model suppliers) and full version for suppliers with design authority
- MBE Compatibility Tests (Data Integrity)**
 - Validates suppliers' answers and data quality through practical scenarios using digital models to test:
 - Technical capability in several domains
 - MBE tool usability
 - Standards adoption
 - Model-based related procedures
 - Readiness level to perform collaboration

A&D PLM Action Group Recommendation

DIRECT Communication:

- Limit SysML authoring products to one specific brand
- Limit SysML authoring products to popular brands and use a third party translation tool

INDIRECT Communication:

- Use a in-direct transformation product to integrate multiple model types (requires integration of additional data management environment.)

Key Takeaways

1. Customer expectations for digital collaboration are driving the MBE transformation for Supply Chain.
2. Robust Model Based Exchange (MBX) tools are required to enable digital exchange and collaboration
3. Emerging technology, tools, and user stories require formal assessment and evaluation. Data from assessments should provide guidance for future capabilities development.
4. Current tools lack capabilities for concurrent collaboration (OEMs must be prescriptive to tool vendors).
5. OEM – Supplier Compatibility is key for a successful collaboration (advocating for the adoption of data interoperability standards).
